

Forbes Global 2000 (2026)

Data Dictionary — Cleaned Dataset Schema Reference

Overview

This document describes every column in the cleaned dataset (**data/processed/forbes_2000_cleaned.csv**), including source columns retained from the raw Forbes Global 2000 export and columns engineered during the cleaning pipeline (**scripts/clean_forbes_2000.py**). The dataset contains 2,000 rows — one per ranked company — and 12 columns.

Column	Type	Origin	Description
Rank	int	Source	Forbes Global 2000 rank, 1–2000. Ties are legitimate: 298 companies share a rank with at least one other company.
Company	str	Source	Company name as published by Forbes. No duplicates.
Country	str	Engineered	Extracted from the raw 'Headquarters' field (split on the last comma). 62 unique countries. One row (Klepierre) is missing this information.
City	str	Engineered	Extracted from 'Headquarters' alongside Country. Null for the one row where Headquarters could not be parsed.
Industry	str	Source + 1 imputed	28 industry categories. One row (Medline) was missing Industry in the raw file and was assigned to 'Pharmaceuticals'.
Sales (\$B)	float	Source	Annual revenue in billions of US dollars. No missing or negative values.
Profit (\$B)	float	Source	Net profit in billions of US dollars. No missing or negative values.
Assets (\$B)	float	Source	Total assets in billions of US dollars. No missing or negative values.
Market Value (\$B)	float	Source	Market capitalization in billions of US dollars. One row (Revolution Medicines) is missing this information.
Profit_Margin_%	float	Derived	$(\text{Profit (\$B)} / \text{Sales (\$B)}) \times 100$. Rounded to 2 decimals.
Asset_Efficiency	float	Derived	$\text{Sales (\$B)} / \text{Assets (\$B)}$. Rounded to 3 decimals. Higher values indicate more revenue generated per dollar of assets.
ROA_%	float	Derived	$(\text{Profit (\$B)} / \text{Assets (\$B)}) \times 100$ — Return on Assets. Rounded to 2 decimals.

Known Data Quality Notes

- **Duplicate ranks are expected, not an error.** Forbes ties companies at the same rank when their composite scores match; 298 of 2,000 rows share a rank with another company.
- **Outlier profit margins are retained.** A small number of companies (e.g. Broadcom, at roughly 2,484%) show profit margins far above 100% due to one-off accounting events (such as large asset sales or tax adjustments) relative to a small revenue base. These are flagged in the quality report but not removed or capped, since they reflect the source data accurately.
- **Two rows retain nulls after cleaning by design:** Market Value (\$B) for Revolution Medicines (no reliable way to estimate it from other columns), and City for Klepierre (Headquarters listed only a country).
